### Ozone hole formation

- The ozone hole occurs mostly during spring season in Antarctic region (from September to early December) as strong westerly winds circulate around the continent and create an atmospheric container.
- During this period there will not be sunlight for three months and temperature is -80 degrees. This leads to formation of **Polar Stratospheric clouds (PSC)**.
- The PSC provide a platform for chemical reactions whose products will lead to ozone destruction.

O3 = OZONE      Cl = Chlorine
